

Scanning Probe Microscope

SPM-9700

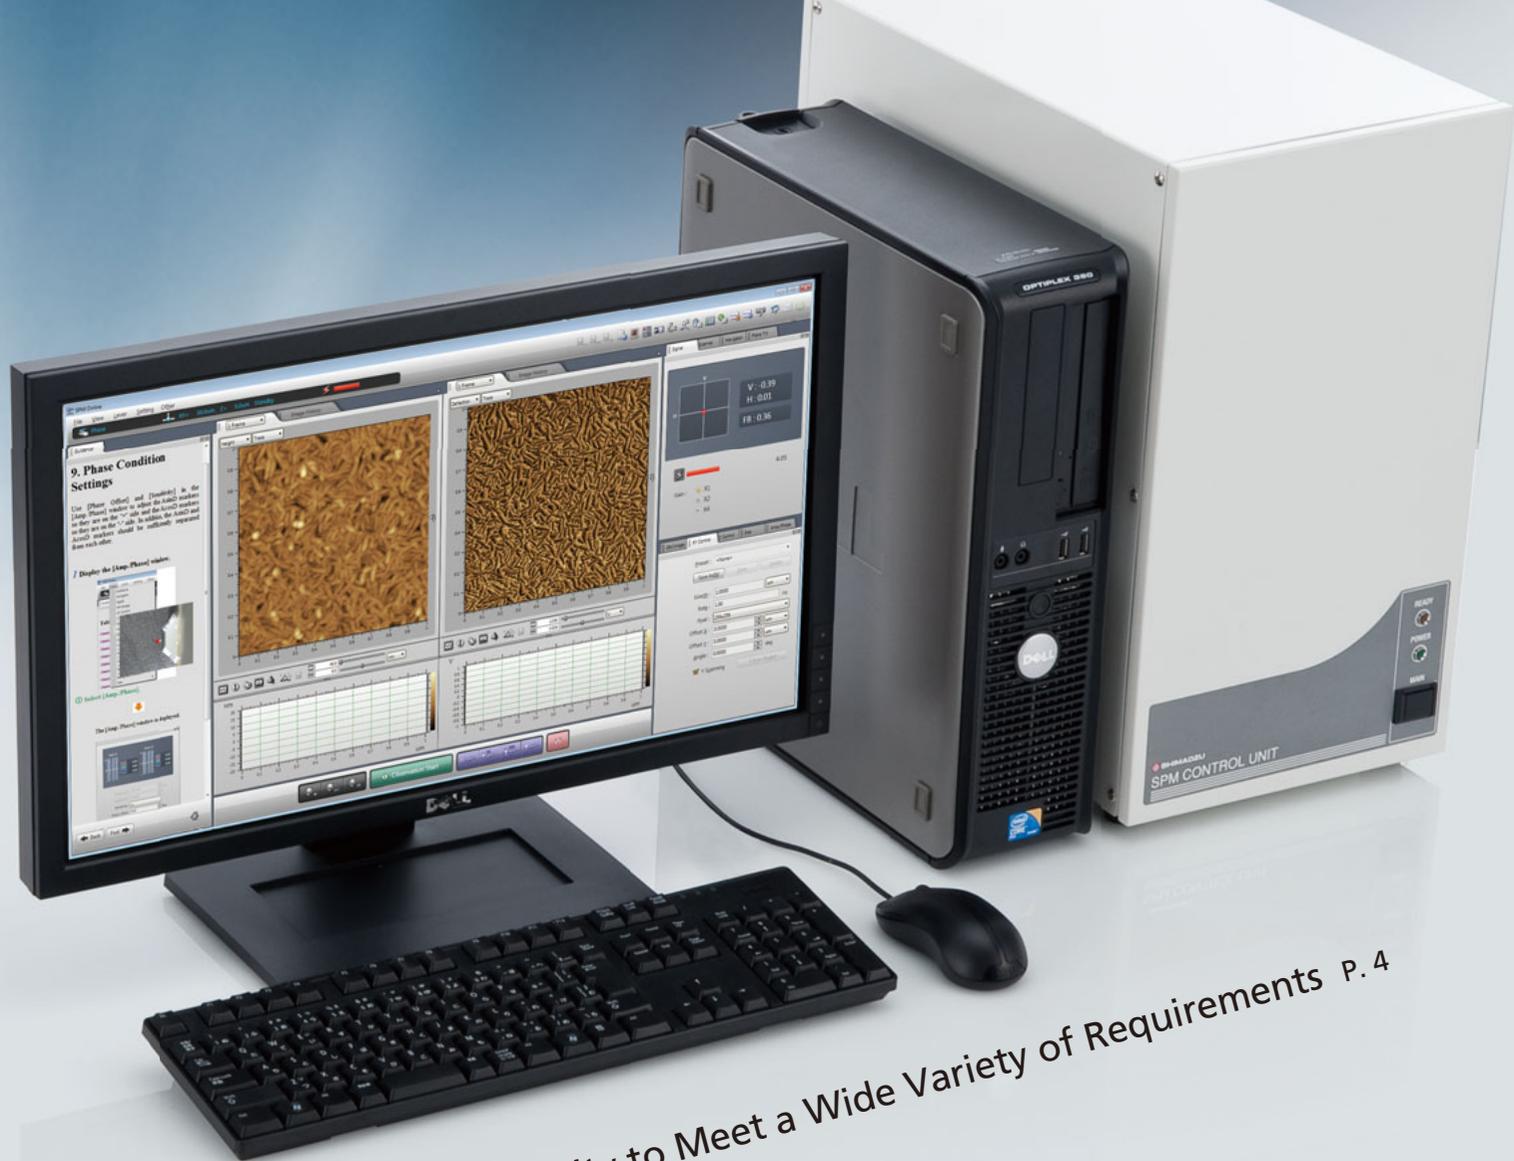

Making the Unknown Visible

Scanning probe microscope (SPM) is a generic term for microscopes that scan sample surfaces with an extremely sharp probe to observe their three-dimensional image or local properties at high magnifications.
The SPM-9700 offers higher performance, faster speeds, and easier operation.

Head-Slide Mechanism – High Stability

Allows Sliding the Entire Optical Lever System as a Single Unit, While Maintaining High Rigidity.

- The laser remains stable and irradiates the cantilever even while replacing samples.
- Design is resistant to vibration, noise, wind, and other external disturbances, so a specialized enclosure is not necessary.
- The main unit includes a built-in vibration isolator.

Ease of Operation Minimizes Distraction from Observation to Analysis

A revolutionary layout-free graphical user interface (GUI) provides borderless support for operations ranging from online observation to offline analysis. This means the SPM can be operated from observation to analysis without confusion.

Operate Without Confusion

From startup to observation and analysis, the SPM can be operated using only mouse clicks; no complicated settings are required

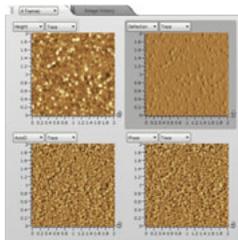

1 Startup
Select the observation mode in the manager window.

2 Setup
Follow the steps indicated in the guidance window to easily complete setup.

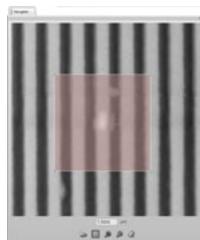

3 Start Observation
Clicking the [Observation Start] button performs all operations automatically, from approach to observation.

Determine the Observation Position Without Confusion

1 Observation Window

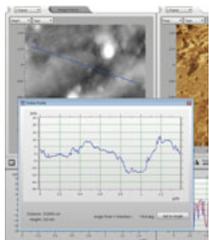

Up to 8 images can be displayed simultaneously. This means the surface shape and physical properties can be compared in multiple images, while scanning.

2 Navigator

The Navigator allows freely navigating from a broad area to any specific area desired. Saved image data can be displayed as reference as well.

Obtain Observation Results Without Confusion

3 Online Profile

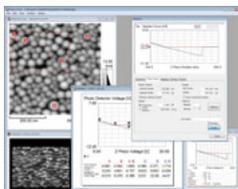

Cross-section profiles can be measured in the online window while observing samples.

4 Image History

Past image data can be displayed next to current observation images for comparison.

Wide Assortment of Scanning Functions

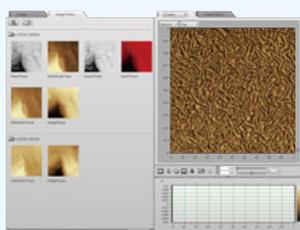

5 Force Mapping (special order)

A force curve can be measured for each point in observed image data to acquire a distribution of sample mechanical properties or adhesion force.

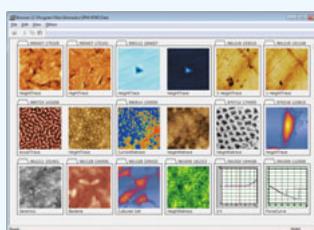

6 Vector Scanning (special order)

The scanning direction, force between the probe and sample, or the applied voltage can be programmed to allow scanning according to a program.

4 Display

Image data observed in the past can be viewed without switching offline.

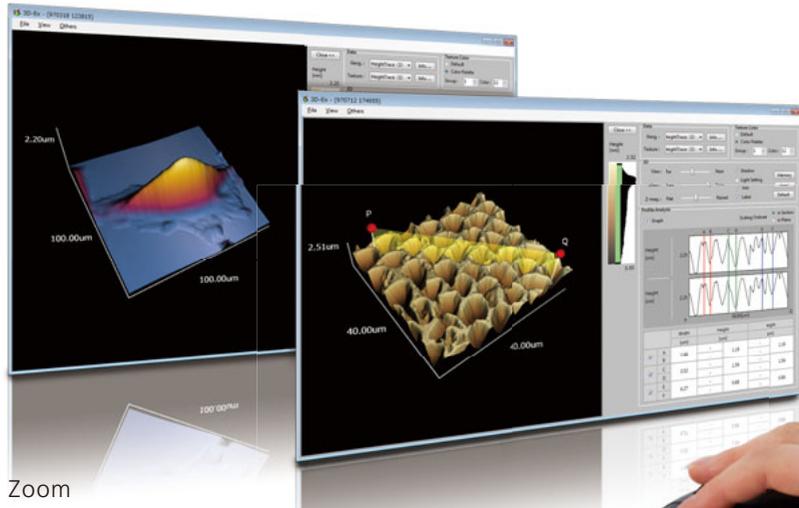

5 Offline Analysis

A wide selection of functions for displaying, processing, and analyzing images are available for expressing observation results more attractively and quantitatively.

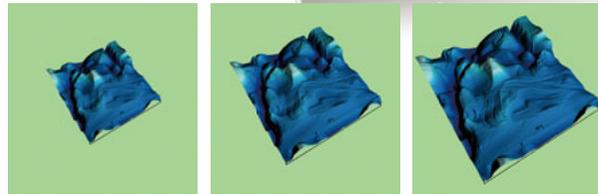

Improved Usability!

Wide Variety of 3D Rendering Functions Using Mouse Operations

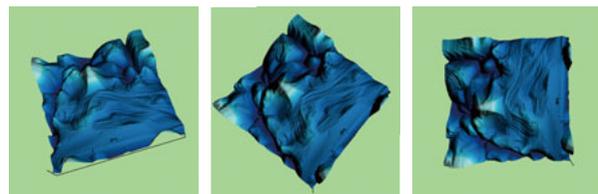

Use the mouse to freely rotate images, zoom, or change the Z-axis magnification. This enables expressing image data in a variety of ways while confirming the data in real time.

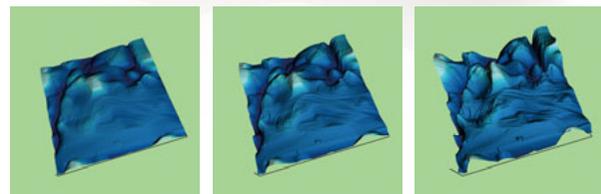

Zoom

Rotation

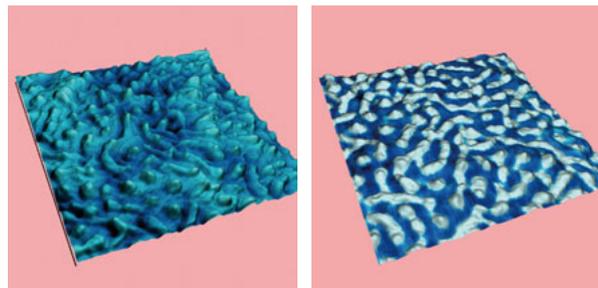

Change Z-Axis Magnification

Texture Function

Height information can be displayed overlaid with information about other physical properties. This allows clearly showing the relationship between both parameters.

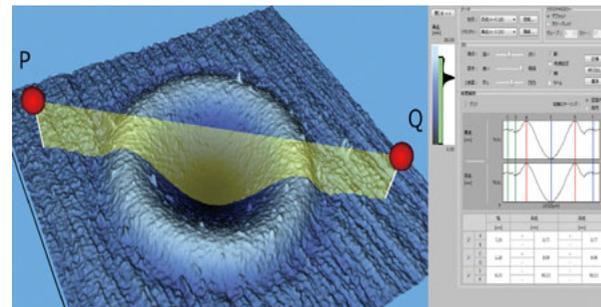

3D Image

Overlay of Topographic Image and Phase Image

3D Cross-Section Profile Analysis

Cross-section profiles can be analyzed in 3D images. If physical property information is expressed in terms of texture, respective cross-section profiles can be displayed and analyzed in the same location.

Particle Analysis Software (option)

The particle analysis software extracts multiple particles from SPM-9700 image data and calculates feature values for each particle, then analyzes and displays them. This is especially useful for processing data statistically. The following wide selection of feature values and their corresponding statistical quantities can be calculated, tabulated, sorted, or graphed. Numerical data can be exported.

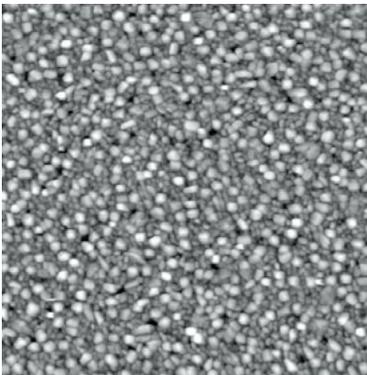

Feature Parameters

- | | |

SPM Data Room Website

The SPM Data Room website includes examples of new observation data, applications, a list of scientific articles, and a list of presentations.

01 Living Organisms

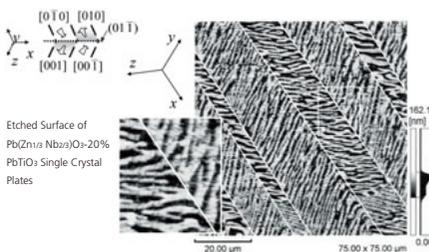

E. coli Bacteria

E. coli bacteria were dried on a substrate and observed in liquid media. (Data provided by Ms. Ikemoto and Dr. Kogure, Atmosphere and Ocean Research Institute, The University of Tokyo)

03 Non-Metals

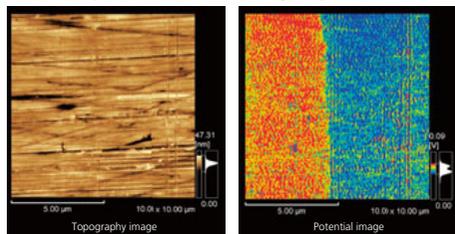

Ferroelectric Domains

By etching the surface, the domain wall structure of ferroelectric crystal surfaces can be observed. (Data provided by Dr. Iwata, Faculty of Engineering, Nagoya Institute of Technology)

02 Metals

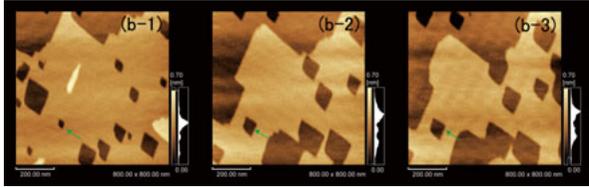

Boundary Surface of Plating Layer

A cross-section of a copper (Cu) plated iron (Fe) sample was prepared, and the electric potential measured along the boundary surface. The topographic image on the left does not show any change in thickness, but the electric potential image on the right shows that the iron portion has a potential that is about 90 mV higher.

04 Minerals

Observation of Calcite in Solution

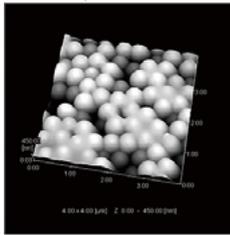

The crystal dissolution process of calcite in solution was observed. Propagation steps of about 0.3 nm, due to dissolution, were observed. About 10 minutes elapsed between (b-1) and (b-3).

(Data provided by Dr. Kagi, School of Science, The University of Tokyo)

05 Ceramics

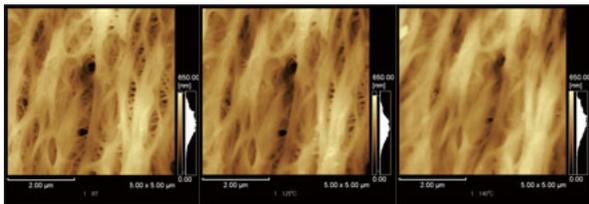

Film Dispersed with Silica

Film material with mono-dispersed spherical silica dispersed in an organic binder. This clearly shows how the binder binds the spherical particles. (Data provided by Japan Fine Ceramics Center (JFCC))

06 Polymers

Li-Ion Battery Separator

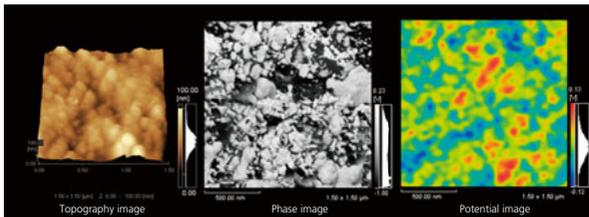

Room Temperature 125 °C 140 °C

The separator surface was observed after removal from the lithium-ion battery. Heated observation shows how the fiber swells at high temperatures and fills the pores.

07 Powders

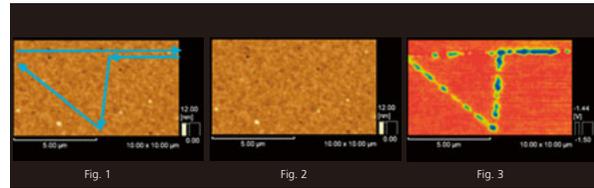

Toner Particle

The top part of one toner particle was observed at high magnification. A topographic image of the surface is shown on the left. Phase and surface potential (KFM) images are shown on the right. The images on the right show how comparing images of different properties in the same field of view allows correlating the distribution of toner material and external additives with the corresponding electric potential distribution.

08 Nanotechnology

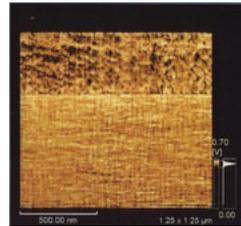

Rendering Images Using Electric Potential

Vector scanning was used on a gold vapor deposition surface on a silicon substrate to render the trace shown in Fig. 1. A conductive cantilever was used to apply a tiny electric potential between the sample and probe. After rendering, simultaneous AFM and KFM measurements showed no change in the shape of the AFM image (Fig. 2), but the potential measured along the trace in the KFM image (Fig. 3) was about 50 mV lower than the surrounding area.

09 Thin Films

Cross-Section of Thin Film

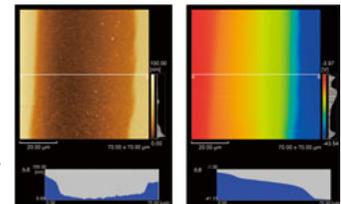

A cross-section of an organic thin film vapor-deposited on a silicon substrate was observed with the SPM by turning the sample so the cut edge faced upward.

The boundary can be clearly observed. This shows that about the top 1/3 is the organic film layer, which is 390 nm thick. This application example is only possible because of the stable probe control provided by the SPM-9700.

10 Semiconductors

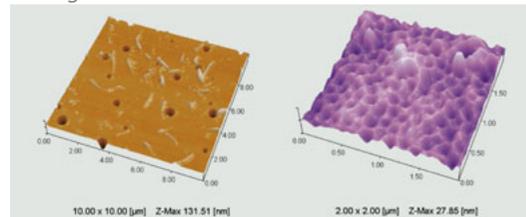

Electric Potential Analysis of Organic Thin Film Transistor (FET)

This is an example of analyzing the shape and electric potential of organic thin film transistors, which have gained attention for their use in flexible displays and other applications. The film material is P3HT (3-hexylthiophene), which provides high electron mobility. To use the SPM for actual measurement, the source electrode was grounded and an electric potential was applied independently to the gate and drain electrodes, then the variation in surface potential on the gate was determined. (Data provided by Dr. Fukuda, Department of Information and Electronic Engineering, Muroran Institute of Technology)

11 Coatings

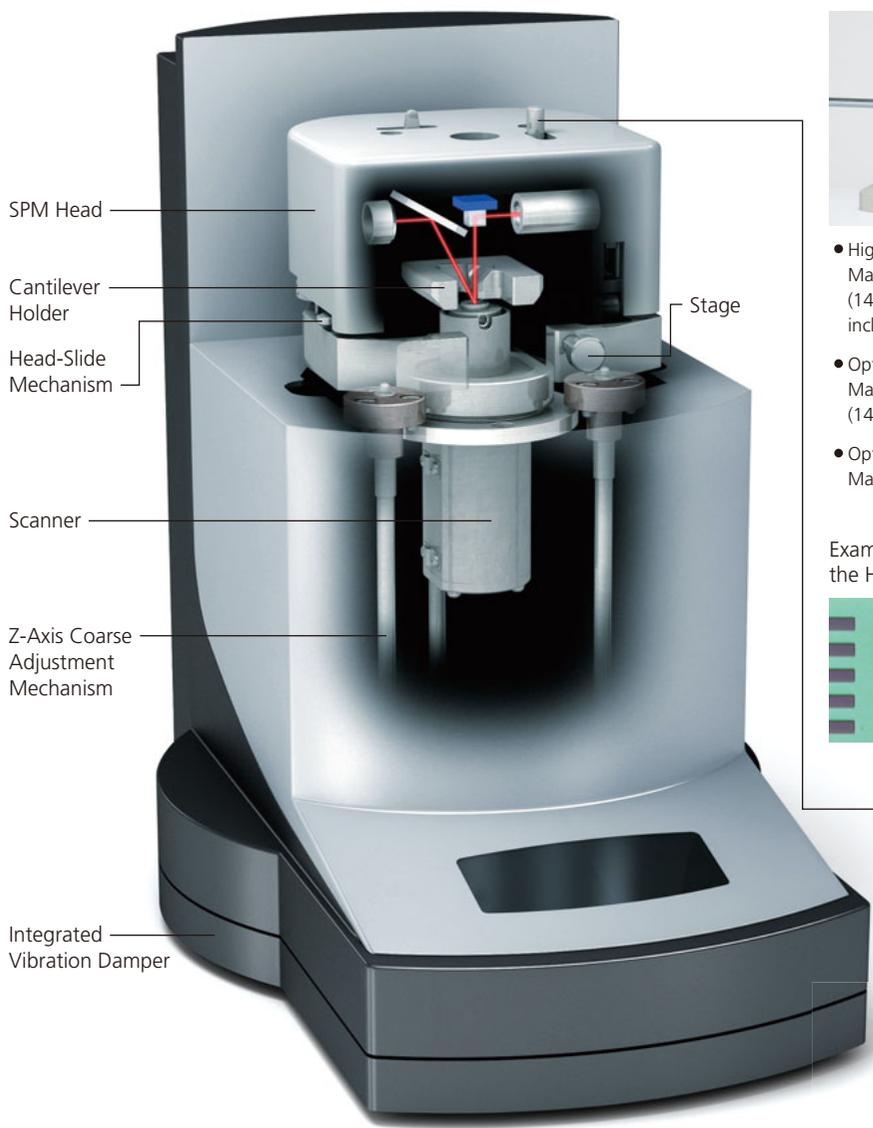

Baking Finished Surface

The coated surface shows many holes from outgassing. The metallic painted surface (left) shows it contains metal fibers.

SPM-9700 Scanning Probe Microscope

SPM Unit

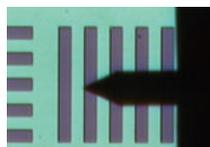

Example of Optical Microscope Setups

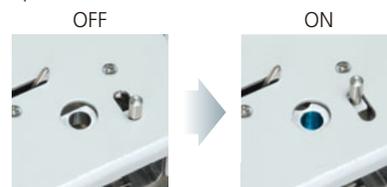

- High Magnification Optical Microscope Unit (with CCD)
Magnification of Display Monitor: 48x to 900x zoom
(14-inch display mode)
including coaxial epi-illumination
- Optical Microscope Unit (with CCD)
Magnification of Display Monitor: 100x
(14-inch display mode)
- Optical Microscope Unit (without CCD)
Magnification: 40x (20x ocular and 2x objective)

Example of Observing a Sample and Cantilever Using the High Magnification Optical Microscope Unit

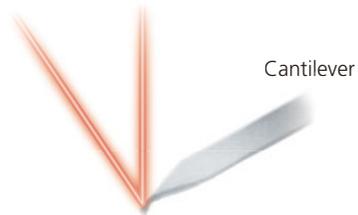

The splitter slide mechanism enables obtaining a bright optical microscope image.
Field-of-View: 270 μm \times 180 μm
Cantilever: NCH

Splitter-Slide Mechanism

(Japanese Patent No. 4032272)

Specifications for SPM Unit

Resolution	XY: 0.2 nm, Z: 0.01 nm
Max. Scanning Range (X, Y, Z)	Standard scanner X and Y: 30 μm Z: 5 μm
	Wide range scanner X and Y: 125 μm Z: 7 μm
	Deep scanner X and Y: 55 μm Z: 13 μm
	Narrow range scanner X and Y: 2.5 μm Z: 0.3 μm
Stage	Max. sample size: 24 mm dia. \times 8 mm Sample replacement method: Head-slide mechanism with integrated displacement detection system and cantilever Samples can be replaced without removing cantilever. Sample securing method: Secured with magnets

Consumable Parts

Cantilever for contact mode	SiN	Set of 34 chips
Cantilever for dynamic mode	Si	Set of 20 chips
Cantilever for magnetic force mode (MFM)	Si	Set of 20 chips
Cantilever for current mode	Si	Set of 20 chips
Cantilever for surface potential mode (KFM)	Si	Set of 20 chips

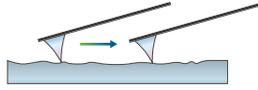

* Many other types of cantilevers are also available.
Contact your Shimadzu representative for details.

Standard Functions

Contact Mode

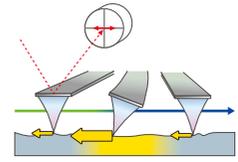

This mode creates an image of displacement in the sample height direction by scanning the sample surface with the repulsive force acting between the cantilever tip and sample kept constant.

Force curves can be measured as well.

Lateral Force Mode (LFM)

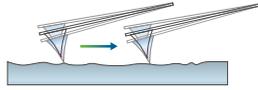

By detecting the amount of twist in the cantilever during contact mode scanning, an image can be created from information corresponding to lateral forces (friction) acting between the sample and cantilever.

Dynamic Mode

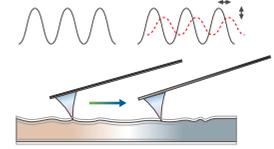

This mode vibrates the cantilever near its resonant frequency. Since the amplitude changes as the cantilever approaches the sample, a sample height displacement image can be created by moving the probe to keep the amplitude constant.

Force curves can be measured as well.

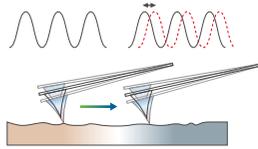

Force Modulation Mode

This mode vibrates the sample at constant amplitude and frequency during contact mode scanning. The cantilever response is detected by separating it into its amplitude and phase components. This allows creating an image of differences in sample surface properties.

Phase Mode

This mode detects the phase shift delay in the cantilever vibration during dynamic mode scanning. This allows creating an image of differences in sample surface properties.

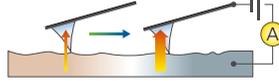

Optional Functions

Current Mode

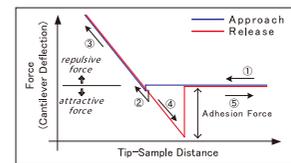

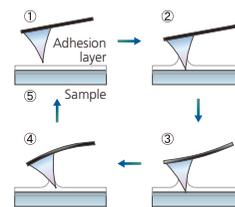

This mode applies a voltage between a conductive cantilever and sample during contact mode scanning and creates an image from the distribution of current flows.

I/V measurement is also possible.

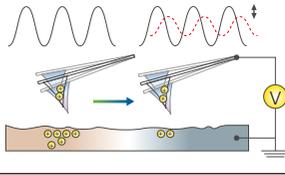

Force Mapping (special order)

A force curve can be measured for each point in observed image data to observe a distribution of sample mechanical properties or adhesive strength.

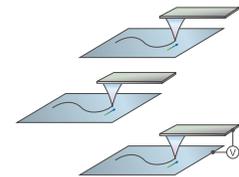

Surface Potential Mode (KFM)

An image can be created from the electric potential of the sample surface by applying an alternating current electrical signal to a conductive cantilever and detecting the static electric force acting between the sample surface and cantilever.

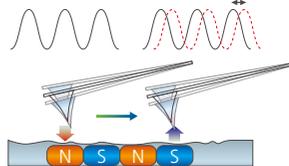

Vector Scanning (special order)

The scanning direction, force between the probe and sample, or the applied voltage can be programmed to allow scanning according to a program.

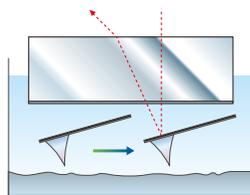

Magnetic Force Mode (MFM)

This mode scans the sample with a magnetic tipped cantilever kept at a constant distance from the sample. An image can be created from magnetic information of the sample surface obtained by detecting the magnetic force from the magnetic leakage field.

Petri Dish Type Solution Cell

The sample is attached to the bottom of a small petri dish, which is then filled with solution. By scanning with the cantilever immersed in solution, AFM observations can be performed in solutions.

Electrochemical Solution Cell

This cell is used for AFM observations of sample surface changes while an electrochemical reaction occurs in an electrolytic solution. The cell includes three standard electrodes (working, counter, and reference) and includes a petri dish type solution cell.

(Does not include the separately-ordered electrochemical controller (potentiostat).)

Environment Controlled Scanning Probe Microscope WET-SPM Series

SPM Observations in a Controlled Environment

By adding an environment controlled chamber, the SPM-9700 scanning probe microscope can be upgraded to a WET-SPM series system. This is only possible for the SPM-9700, which was optimized for operating within a controlled chamber, by including features such as a Shimadzu proprietary head-slide mechanism, operation from the front panel, fully automatic approach, and open head design.

This is especially ideal for samples vulnerable to air or moisture.

Environment Controlled Chamber CH-II /CH-III

These environment controlled chambers, CH-II (without TMP) and CH-III (with TMP), were designed specifically for the SPM-9700 series as a chamber system with a built-in vibration damper. Since this enables controlling both the sample and surrounding environment, the SPM can be used to directly observe samples processed in a controlled environment (Japanese Patent No. 2612395, US Patent No. 5200616). A large view port and dual glove ports allow pretreating samples inside the chamber. Adding the option for in-situ SPM permits real-time investigation of surface changes due to changes in physical parameters such as temperature, humidity, pressure, luminescence, and concentration. The SPM unit can be easily loaded into and unloaded from the chamber from the rear, allowing it to be used for both ambient atmosphere and controlled environment observations.

Specifications

Port	Glove port	2
	Large view port	1
	Unit loading port	1
	Sample loading port	1
	Pumping port	1
	Spare port	4
Pumps Used for Vacuum System	Rotary pump (160 L/min)	
	Turbomolecular pump (50 L/sec) (CH-III only)	
Gas Introduction Mechanism	Single-circuit automatic control	
Current Input Terminals (7-pin)	16 (including spares)	
Vibration Damper	Integrated air-spring vibration damper	

WET-SPM Series Options

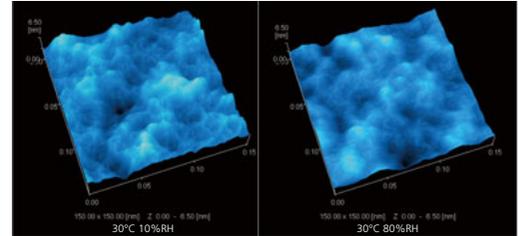

Temperature and Humidity Controller

Controller is attached to an environment controlled chamber to control the temperature and humidity inside the chamber.

Humidified Gas Generator

FC Film Observation with Environmentally Controlled Temperature and Humidity

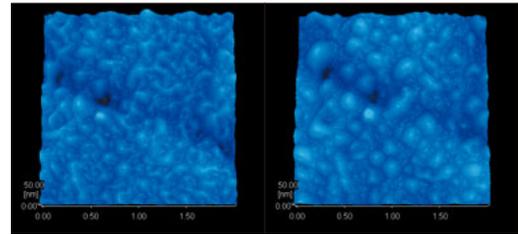

Low Temperature

High Temperature

Variations in the surface shape of Nafion film due to changes in humidity were observed.

In each case, microscopic features of about a few nm in height were observed, but the images show that increasing the humidity results in smoother features and more swelling.

Polymer Film

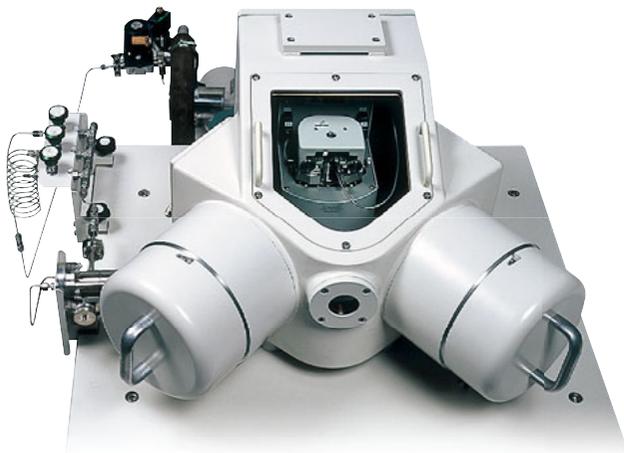

Low Temperature

High Temperature

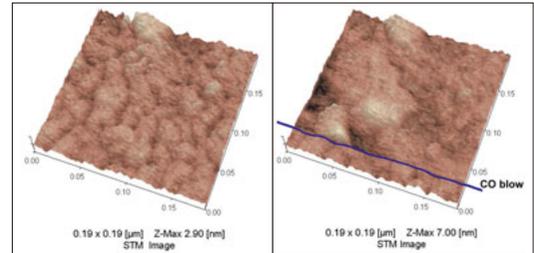

Variations in the shape of polymer film were observed using a controlled temperature and humidity environment.

Gas Spray Unit

The gas spray unit is attached to a spare port to spray small amounts of gas on the sample.

Real Time Observation of Nickel Surface Variations

The nickel surface's reaction to gas was observed continuously in real time. When the clean surface after reduction (left) started being sprayed with carbon monoxide, the change in shape was observed as carbonyl complexes were formed (right).

(Data provided by former National Institute of Materials and Chemical Research)

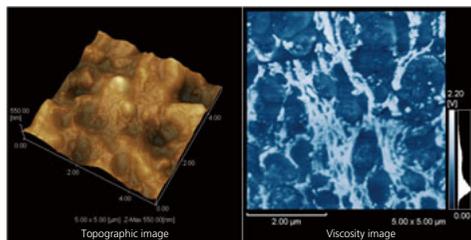

Sample Heating and Cooling Unit

The sample can be loaded into the unit and heated or cooled.

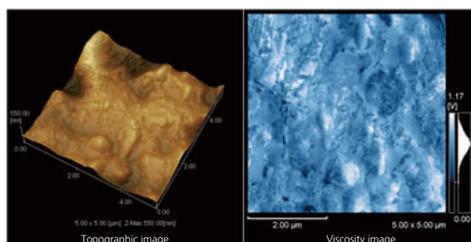

Temperature Controller

Observation of Cooled Plastic

Room Temperature

Two separate phases were observed in the viscosity image.

Cooled to -30 °C

After cooling, there were almost no visible differences in viscosity.

Sample Heating Unit

The sample can be loaded into the unit and heated.

The unit can even be operated in atmospheric conditions, depending on the sample.

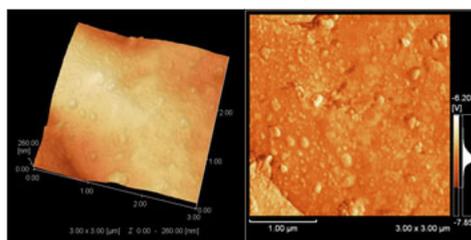

Temperature Controller

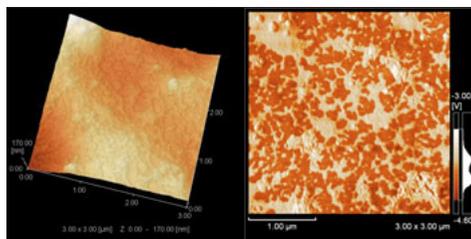

Heated Holder Installed in Scanner

Observation of Heated Polymer Film

30°C

50°C

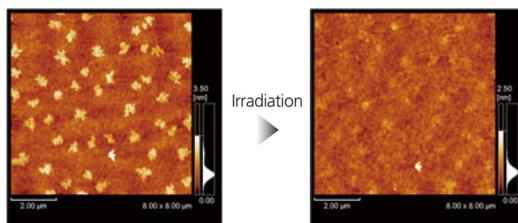

The phase image (right) clearly shows the changes in sample surface physical properties as the sample is heated.

Light Irradiation Unit

This unit enables the use of a fiber optic light to irradiate sample surfaces. It does not include the light source or the optical fiber. It can be operated in atmospheric conditions.

Observation of Ultraviolet Light Irradiating Pentacene Thin Film on SrTiO₃

Before Irradiation

40 Minutes After Irradiation

The pentacene thin film was formed as a cluster of two or three 1.6 nm thick layers. When irradiated with 365 nm wavelength ultraviolet light, the cluster structure gradually started breaking apart. After 40 minutes, the thin film cluster was mostly gone. During this time, there is negligible drift and observation is possible using the same field of view.

(Data provided by Dr. Yuji Matsumoto, Frontier Research Center, Tokyo Institute of Technology)

Specifications

1. SPM Unit

Observation Modes	Standard	Contact Dynamic Phase Lateral Force (LFM) Force Modulation
	Optional	Magnetic Force (MFM) Current Surface Potential (KFM)
Resolution	X, Y	0.2 nm
	Z	0.01 nm
SPM Head	Displacement detection system	Light source/Optical lever/Detector
	Light source	Laser diode (ON/OFF) Irradiates cantilever continuously, even while replacing samples.
	Detector	Photodetector
Scanner	Drive element	Tube piezoelectric element
	Max. scanning size (X, Y, Z)	30 μm \times 30 μm \times 5 μm 125 μm \times 125 μm \times 7 μm (optional) 55 μm \times 55 μm \times 13 μm (optional) 2.5 μm \times 2.5 μm \times 0.3 μm (optional)
Stage	Max. sample size	24 mm dia. \times 8 mm
	Sample replacement method	Head-slide mechanism with integrated displacement detection system and cantilever Samples can be replaced without removing cantilever.
	Sample securing method	Magnet
Z-Axis Coarse Adjustment Mechanism	Method	Automatic, using stepping motor Fully automatic, regardless of sample thickness
	Max. stroke	10 mm
Signal Display Panel	Displayed quantity	Total incident light to detector (digital display)
Vibration Isolation System	Vibration Damper	Built into SPM unit
Optical Microscope Observation	Method	Beam-splitter slide mechanism
Specialized enclosure	Method	Not necessary or environment controlled chamber is used.
Environment Control	Method	Chamber can be added without modifying SPM unit.

2. Control Unit

Scan Controller	XY-axis control	± 211 V, full time 16-bit accuracy
	Z-axis control	± 211 V, max. 26-bit accuracy
Feedback Controller	Control system	Digital control by DSP
Data Acquisition Controller	Input signal	5 channels (standard) 7 channels (optional)
Communications Interface	Protocol	TCP/IP

3. Data Processing Unit

Host Computer	Operating system	Windows 7 Professional (32-bit), English version
	RAM	2GB min
	Storage	HDD 160GB min. CD-RW drive
	Graphics	memory : 256MB min.
Monitor	Panel	Flat panel display Display resolution : 1920 \times 1080 pixels
Communications Interface	Protocol	TCP/IP

4. Software

Online	Input Signal	Select from up to 6 signals.
	Image data display	Maximum 8 images can be displayed simultaneously.
	Scanning direction	Trace/retrace (simultaneous observation possible) Angle setting can be changed.
	Scanning size	0.1 nm to max. scanning size (depending on scanner type) Offset setting can be changed.
	Number of pixels	2048 \times 2048, 1024 \times 1024, 512 \times 512, 256 \times 256, 128 \times 128, 64 \times 64, 32 \times 32
	Data size	Approx. 16 MB to 64 KB/data
	Observation window	Multiple frames display: 1 frame, frames, 2 frame, frames (Vertical or Horizontal), or 4 frame, frames Z-axis display range settings (display range, offset) Color palette settings (400 types) Tilt correction setting Image history display modes (list, single screen)
	Profile display	Display cross-section profile during scanning, and save (both directions). Display cross-section profile at scanning position, analyze profile between any two points.
	Status display	Display the operating status of the main unit.
	Preset	Register and retrieve parameter settings.
	Calibration	Independent calibration of each axis (X, Y, and Z)
	Scanning	Switch XY-scanning ON/OFF Switch Y-scanning ON/OFF Y-scanning can be restarted. Y-scanning start position can be changed (top, center, or bottom).
	Signal display	Display detector vertical/horizontal variation signal. Display feedback signal. Display laser intensity.
	Navigator	Display scanning size, move positions, change scanning size, change angle. Load and display image data.
	Offline	Image history
Guidance		Display operating procedures.
Browser		List in thumbnail mode Delete, copy, move, or search data. Change group names or data names. Create/delete folders.
Image data display		Variable shade image (top view) display (length measurement possible) Pseudo-3D display, 3D display Zoom in/out or rotate 3D display (mouse operation possible) Analyze cross-section profile of 3D display. Set light source, view angle, and gloss settings for 3D-image display. Display contour lines. Create, edit, and select color palettes. Change Z-axis range setting, set Z-axis units. Reduce/enlarge image, create as icon. Display image data information (parameters, image processing history, comments). Enter and display comments.
Line data display		Overlay, tile, overwrite. Line colors can be changed. Reduce/enlarge image, create as icon.
Image data processing		Flatten, erase noisy lines. Local filter, spectrum filter Zoom, invert, and rotate image. Resample, extract lines, use macro functions.
Image data analysis		Profile analysis, line roughness analysis. Surface roughness analysis, topography analysis, step measurement. Power spectrum analysis, autocorrelation analysis Fractal analysis, line length analysis, line roughness analysis
File output		DIB format (bitmap) TIFF format, ASCII format

Installation Specifications

● Installation Environment

The following conditions are appropriate for the room where the SPM is installed.

Temperature : 23 °C ± 5 °C
Relative Humidity : 60 % max.

● Power Supply

The following power supply is required to operate the SPM-9700.

SPM-9700

Single-phase 100 - 120 V / 200 - 240 V, 50/60 Hz, 15 A - 2 circuits

Grounding Resistance: 100 Ω max.

* The power supply indicated above is for a basic configuration of the SPM-9700 and can vary depending on the options included. Please see specifications for details.

Environment Controlled Chamber

Single-phase 100 - 120 V, 50/60 Hz, 15 A - 2 circuits

Grounding Resistance: 100 Ω max.

● Size and Weight of Units

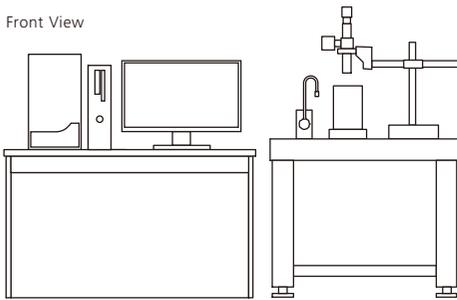

SPM Unit	W180 × D255 × H260mm	5.5kg
Controller	W250 × D420 × H454mm	18.5kg
Environment Controlled Chamber	W1170 × D725 × H1055mm	210kg

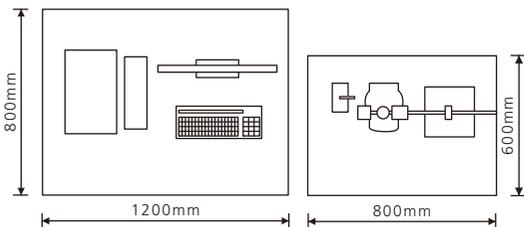

Installation Example * Figure shows example of one possible configuration.
